**9** Alkenes, which contain five carbon atoms, are raw materials for the production of synthetic rubber.

It is proposed the alkene:  $\text{CH}_2=\text{C}(\text{CH}_3)-\text{CH}_2-\text{CH}_3$

*For this alkene:*

**I.** Write the name according to the systematic nomenclature: \_\_\_\_\_

**II.** Write the molecular formula of the substance and the general formula of the homologous series:

### *molecular formula*

### *formula of the homologous series*

**III.** Complete the blank spaces of the table:

	<i>Structural semi-developed formula</i>	<i>Name</i>
Chain isomer		
Double bond position isomer		
Homologue		

**10** *Calcium formate* is used in building mortar and all types of concrete in order to accelerate cement hardening.

**Solve the problem.** Calculate the weight of calcium formate obtained from formic acid with a weight of 92 g, if the reaction proceeds according to the following scheme:

*It is given:*

*Solution:*
